

Platform UX · June 2026

Platform VM Detail

Machine-first, task-second operator layout

Hero strip, compact action row, prioritized attention stack, single Connect hub, and deep work on dedicated tabs — redesigned for daily VM operations.

The Problem

VM detail used to bury connectivity, NAT, and doctor signals inside a long Overview scroll.

Before

- Daily access, NAT, and laptop checklist scattered across panels
- Doctor, XML, and host FS noise on Overview
- Power actions mixed with navigation chrome
- No single "connect now" surface

After

- One Connect hub on Overview + full Access tab
- Attention stack shows top blocker; chips swap banners
- Action bar: Cinema, SSH, contextual power
- Overview keeps live metrics only

Connect hub

13

QA features (F01–F13)

Access

Primary tab

Page Zones

Top-to-bottom priority matches how operators actually work.

Zone	Component	Operator value
Hero	VmDetailHero	Live state, health pills, blocker CTA, gradient identity
Actions	VmDetailActionBar	Open Cinema, SSH, Start/Shutdown/Resume + Power & more
Attention	VmAttentionStack	One expanded banner; secondary issues as chips
Connect	VmConnectHub	Cinema, SSH, laptop path, NAT, export
Overview	Info cards + usage	Desired state, compute, doctor one-liner — no XML bloat

ATTENTION

Attention Stack

Show the highest-impact issue expanded; demote the rest to chips.

Priority 1

Pending config shutdown — VM waiting on operator approval before power change.

Priority 2

Guest agent offline — metrics and IP discovery degraded until qemu-guest-agent returns.

Priority 3

Laptop NAT path incomplete — libvirt NAT guest missing expose-SSH or copy command.

Interaction rules

- Only **one** banner expanded at a time
- Click a chip to swap which banner is expanded
- Guest-agent dismiss persists per VM in `localStorage`
- Ask Zeus opens Spotlight with VM blockers via `vmDetailSpotlight.ts`

Access **Tab** & Slim Overview

Deep connectivity work moves to Access; Overview stays scannable.

Access tab (?tab=access)

- Full Connect hub with NAT panel expanded
- Export spec JSON + domain XML
- Links to Guest security & ports, Guest health
- Same NAT presets as Network → Hypervisor NAT

Removed from Overview

- Host resources → host detail link
- Full doctor panel → Doctor tab
- Domain XML editor → Settings tab
- Organization fields → Settings tab

Try it

Platform → VMs → pick a running NAT guest → Overview Connect hub → Access tab for NAT + export.

Tests & Automation

F01–F13 Playwright matrix covers hero, action bar, Connect hub, Access tab, ConsoleHub.

Suite	Command	Coverage
Mock matrix	<code>npm run test:e2e:features</code>	Serial F01–F13 with platform mocks
Live matrix	<code>npm run test:e2e:features:live</code>	Read-only checks against lab host
Operator UX	<code>platform-vm-operator.spec.ts</code>	Connect hub, SSH dialog, tabs
