

HyperSDK Platform Suite

Machina - Client overview

Rust-based management plane for libvirt and QEMU/KVM hosts.

Virtualization operations, platform SRE, classic KVM administrators

Executive summary

What this product solves for client teams

- Gives operators one interface for VM lifecycle, consoles, storage, and network management on libvirt-based infrastructure.
- Supports both terminal-first and browser-first workflows without splitting tooling by persona.
- Fits environments that still run classic KVM hosts and need enterprise controls without Kubernetes as the boundary.

Core capabilities

What differentiates the product

Unified access layer

Expose REST, WebSocket, terminal UI, and web UI for the same host and VM workflows.

Console coverage

Supports VNC, SPICE, SSH, and serial access from browser-based and operator-driven workflows.

Operational automation

Adds scheduled actions, webhooks, metrics, and alerting hooks around core lifecycle tasks.

Enterprise controls

Integrates PAM authentication with RBAC for safer multi-user operations on shared KVM estates.

Operational fit

Where this product lands fastest

High-value use cases

- Modernizing legacy libvirt estates without forcing a Kubernetes control-plane migration.
- Providing secure browser consoles and terminal workflows for operations teams.
- Standardizing VM host operations across multiple KVM clusters or datacenter pods.

Suite alignment

- Complements v9s for teams that run both classic KVM and KubeVirt in parallel.
- Pairs well with hyper2kvm when converted workloads land on libvirt-managed hosts.
- Extends the suite beyond migration into sustained VM host operations.

Next steps

Recommended follow-through after stakeholder review

- Best next step: map your current libvirt workflows to Machina APIs, consoles, and alerting hooks.
- Ideal follow-on assets: console workflow demo and operations runbook review.
- Schedule a tailored demo or design review at zyvor.dev/contact.
