

virtspawn

[Demo & Scripts Guide](#)

30-step API demo, status dashboard, backup & restore, bulk operations

[scripts/demosh](#) [scripts/status.sh](#)

[scripts/backup.sh](#) [scripts/bulk.sh](#)

All scripts use the REST API & no direct libvirt access needed

Works locally or against any remote virtspawn instance

<https://github.com/ssahani/-virtspawn>

Action	Description	Effect	Command
start	Start all stopped VMs	shutoff -> running	./scripts/bulk.sh start
stop	Force stop all running VMs	running -> shutoff (immediate)	./scripts/bulk.sh stop
shutdown	Graceful shutdown all running	running -> shutoff (ACPI)	./scripts/bulk.sh shutdown
pause	Pause all running VMs	running -> paused	./scripts/bulk.sh pause
resume	Resume all paused VMs	paused -> running	./scripts/bulk.sh resume
reboot	Reboot all running VMs	running -> restart	./scripts/bulk.sh reboot
snapshot	Auto-timestamped snapshot	Creates auto-YYYYMMDD-HHMMSS	./scripts/bulk.sh snapshot
snapshot-clean	Delete all auto-* snapshots	Removes auto-prefixed only	./scripts/bulk.sh snapshot-clean
status	Quick VM status table	Shows all VMs with state	./scripts/bulk.sh status

Examples

```
# Start all stopped VMs
$ ./scripts/bulk.sh start

# Shutdown only specific VMs
$ ./scripts/bulk.sh shutdown vm1 vm2 vm3

# Snapshot all running, then clean old ones
$ ./scripts/bulk.sh snapshot
$ ./scripts/bulk.sh snapshot-clean
```

Quick status

```
$ ./scripts/bulk.sh status

Total: 5 Running: 2 Stopped: 3

running fedora-test 4 vCPU 4096 MB
running photon-os 2 vCPU 2048 MB
shutoff ubuntu-test 4 vCPU 4096 MB
```

30-step API demo

scripts/demosh

Tests all endpoints

creates & deletes a VM

validates security

Environment overview

scripts/statussh

Host

VMs

metrics

networks

storage

service status

Backup & restore

scripts/backupsh

Per-VM

NFS

incremental

checksums

scheduled timer

Batch operations

scripts/bulksh

Start/stop/shutdown/snapshot all VMs at once

Automated installer

install.sh

Dependencies

build

install

start

15 verification tests

All scripts use the REST API & work locally or against any remote virtspawn instance

Set VIRTSPAWN_API=http://remote:8081/api/v1 for remote operation

Quick Reference

```
# Run the 30-step API demo
$ sudo ./scripts/demos.sh

# Check environment status
$ ./scripts/status.sh

# Backup all VM configs
$ ./scripts/backup.sh

# Start all stopped VMs
$ ./scripts/bulk.sh start

# Snapshot all running VMs
$ ./scripts/bulk.sh snapshot

# Shutdown everything gracefully
$ ./scripts/bulk.sh shutdown
```
